

## Altosid® IGR now available in Canada

Horn fly control that does not harm dung beetles, birds, fish, reptiles or other mammals, making it the right choice for your cattle, your operation and our environment.

The horn fly is small, but it has the power to reduce profits. Whether it's lower weight gain or increased cases of mastitis, horn flies eat away at your bottom line.

Altosid® IGR is an insect growth regulator. It controls horn flies by passing through the cow and into the manure where the horn fly lays its eggs. It breaks the horn fly life cycle by preventing pupae from developing into biting adult flies.

**Altosid® IGR in loose mineral is exclusive to Cargill in Canada.** Our highly-palatable Right Now® Emerald mineral helps ensure your cattle get optimum levels of Altosid®.

For best results, start feeding 30 days before horn fly emergence.
